

Dear Editor,

I reviewed the manuscript "Visual distraction alone for the improvement of colonoscopy-related pain and satisfaction: a randomized controlled study" with respect to the following points: statistical methods were suitable and adequately described; losses in observations and reasons were reported; and the word "significance is described with the P values.

Authors used correct techniques and adequately described the statistical methods. The number of observations and reason of missing was given all tables. Only I pointed out that the P value should be noted instead of "n.s.".

Regards,
