Comment: This is an interesting case about the main trunk of superior mesenteric vein resection without reconstruction during surgery for giant pancreatic mucinous cystadenoma. The authors presented the case of a 58-year-old woman with a giant pancreatic mucinous cystadenoma adhering the SMV, underwent an en bloc tumor resection, including the main trunk of SMV and the spleen. And this case indicated that the main trunk of SMV might be resected without venous reconstruction if adequate development of collateralization may already present. 1 There are minor language polishing need to be corrected. 2 References can be updated. 3 Figures are good.

Response :

1. Thank you for your careful review .The language errors of this paper have been revised.
2. Thank you very much for your suggestion. There are few literature reports referring the SMV resection or ligation without reconstruction. We had updated the references cited in this article .
3. Thank you very much for your kind advice. We will collect the image picture of this patient during the next follow-up.

Best regards

Qing-long Jiang
