Responses to reviewers,

Thank you so much for reviewing our original report, entitled "*Ileo-ileal Intussusception Caused by Lymphangioma of Small Bowel treated by Single-Incision Laparoscopic-assisted Ileal Resection*" submitted for possible publication in *World Journal of Gastroenterology*.

Reviewer's comment:

It is a case report rather than an original article. The authors described a patient got Ileo-ileal Intussusception Caused by lymphangioma of Small Bowel, and treated by Single-Incision Laparoscopic-assisted Ileal Resection. Indeed, it is rare. The authors offered an interesting case with well treatment. However, the patient came with a chief complaint of abdominal pain without peritoneal irritation signs. In this situation, abdominal CT theoretically was not indicated. Abdominal sonogram was more suitable. May the authors explain and discuss from this point of view.

*Our response:*

In the present case, we actually performed ultrasonography in our emergency

room, however we could not find out specific lesion by ultrasonography. In other words, we might overlook the lesion unless performing CT imaging. In the present case, presence of a mild tenderness in upper right abdomen was a part of the reason that we mainly check around upper abdomen by ultrasonography result in overlook of ileo-ileal intussusception.

Your kind consideration of this paper would be greatly appreciated.

Sincerely,

Kohga Atsushi, MD
