3 Duodenal gangliocytic paraganglioma with lymph node metastases: A case report and comparative review of 31 cases

Sahara J Cathcart, Aaron R Sasson, Jessica A Kozel, Jennifer M Oliveto, Quan P Ly

Abstract

Gangliocytic paraganglioma (GP) is a rare tumor of uncertain origin most often located in the second portion of the duodenum. It is composed of three cellular components: epithelioid endocrine cells, spindle-like/sustentacular cells, and ganglion-like cells. While this tumor most often behaves in a benign manner, cases with metastasis are reported. We describe the case of a 62-year-old male with a periampullary GP with metastases to two regional lymph nodes who was successfully treated with pancreaticoduodenectomy. Using PubMed, EMBASE, EBSCOhost MEDLINE and
