COMMENTS TO AUTHORS

Very interesting study. In this study, the authors examined the impact of aging on the short-term outcomes following pancreatic resection in elderly patients. Consecutive patients who underwent pancreatic resection were identified and included. The operative time, intraoperative blood loss, postoperative hospital stay and cost were comparable. The authors found that aging is an independent risk factor for severe postoperative complications (grade IIIb-V) after pancreatic resection, the results contribute to more informed decision-making for elderly patients. The references should be updated and the language should be checked again.
