Pressurized intraperitoneal aerosol chemotheprapy after misdiagnosed gastric cancer - a case report

Maciej Nowacki, Dariusz Grzanka, Wojciech Zegarski

Abstract

We report the first pressurized intraperitoneal aerosol chemotherapy (PIPAC) application as rescue therapy before palliative D2-Gastrectomy combined with liver metastasectomy performed in a 49 old woman with peritoneal carcinomatosis (PC) primarily diagnosed and operated due Krukenberg tumor (KT). The PIPAC procedure has been performed with the use of the Cisplatin 7.5 mg/m(2) and doxorubicin 1.5 mg/m(2) scheme for 30 minutes at 37 °C. Eight weeks after PIPAC procedure patient underwent the open – classic D-2 gastrectomy with the creation of Roux-en-Y anastomosis (RNY) combined with liver metastasectomy. Currently the patient underwent the classic scheme of chemotherapy combined with Xeloda
