CHB is defined by the persistence of serum hepatitis B surface antigen (HBsAg) for six months or longer [Hollinger and Lau, 2006]. The natural HBV DNA quantification is important for initial patient evaluation, for monitoring treatment response and for early detection of virological breakthrough on therapy. The ideal HBV ...

Progression and Status of Antiviral Monitor in Patients with CHB: From HBsAg to HBV RNA

Ya-Yun Liu, Xue-Song Liang

Abstract

As alternative indexes of hepatitis B virus (HBV) covalently closed circular DNA (cccDNA) transcriptional activity, HBsAg, Hepatitis B core-related antigen(HbcrAg) and peripheral blood RNA, known as pgRNA have been adocated as noval serum markers for prognosis
