

**Response to reviewers:**

- 1) This review discusses endoscopic therapy for Barrett's esophagus associated dysplasia and early esophageal cancer. The authors systematically list and describe the techniques, efficacy and complication of each ablation modality. Overall it presents a good summary of the current literature in the regard of the endoscopic therapy in Barrett's esophagus.  
Comments: 1. Provide a summary table including techniques, efficacy, complication, and references of each modality. 2. Some typo errors.

**Response:** We thank the reviewer for their kind comments. A summary table has been added and typographic errors corrected.

- 2) Endoscopic Therapy for Barrett's esophagus and Early Esophageal cancer. Where do we go from here? is a good over all review of EET. It reads well and fairly comprehensive. Paper will even shine better if add, cost and learning curve with various options, APC vs RFA and EMR vs ESD.

**Response:** The cost effectiveness of ablative therapy is discussed and highlighted. Learning curve for the different techniques is discussed under modalities for which information is available.
