Gemcitabine-induced haemolytic uremic syndrome, although infrequent, can it be prevented: A case report and review of literature

Esther U Cidon, Pilar A Martinez, Tamas Hickish

Abstract

Gemcitabine is an antineoplastic used to treat several malignancies including pancreatic cancer. Its toxicity profile is well known with myelotoxicity, increased vascular permeability and peripheral oedema as most frequent adverse events. However, several cases of acute renal failure have been reported and haemolytic uremic syndrome (HUS) seems to be the underlying process. The cause of HUS remains unknown but its consequences can be lethal. Therefore, a high grade of
