SPECIFIC COMMENTS TO AUTHORS

I read this study "Clinical Characteristics and Outcomes Associated with Nasal Intermittent Mandatory Ventilation in Acute Pediatric Respiratory Failure" with great interest. In this retrospective analysis, authors concluded that NIMV failure is not

associated with differences in hospital LOS, PICU LOS, or duration of respiratory support. I very much enjoyed reading the study. I'd suggest that author add this limitation that study power is low and the study outcomes need to be verified in larger trials.

SPECIFIC COMMENTS TO AUTHORS

Bronchiolitis is a worldwide condition among infancy during winter times. The score valuation proposed in this study results a helpful aid in case of Acute Pediatric Respiratory Failure. Nasal intermittent Ventilatory Ventilation (NIMV) appears as an

"intermediate stage" that allows its indication as a "non-invasive" positive high-flow ventilation support previously to an early intubation during the Pediatric Admission. Quoted therapeutic behavior in NIMV responders would obviate progressive collateral pulmonary/general complications to childhood intubation due to acute respiratory failure.
