The upgraded role of autophagy in colorectal carcinomas

Evangelos Koustas, Panagiotis Sarantis, Athanassios G Papavassiliou,
 Michalis V Karamouzis

Abstract

Autophagy is a basic catabolic process closely associated with cell degradation cellular components. The role of autophagy in colorectal cancer (CRC) remains controversial. The mechanism of autophagy has been identified as protecting mechanism against tumorigenesis by isolation of damaged organelles, or as cytoprotective mechanism provides energy in hypoxic region of CRC tumors. Mutations in proto-oncogenes such as *RAS* and *BRAF* have been associated with the initiation of autophagy through signalling pathway of *BRAF/MEK/ERK* and *PI3K/AKT/mTOR*. The
