SPECIFIC COMMENTS TO AUTHORS

Although the study failed to identify significant association between autonomic function and AP-FGIDs, the hypothesis is good and worthy investigation since there has been evidence of the link in adult population. I have several comments for the authors to

consider: 1. how did you recruit your control children? from community or school ? more details are needed. SINCE the control population can be large, did you use the random technique to screen children? 2. In statistical analysis, did you still use t test when data are non-normal? remember that the assumption for t test is normal data. suggest to cite a reference for the statistical description (Ann Transl Med. 2016 Mar;4(5):91. doi: 10.21037/atm.2016.02.11.). 3. Since you have matched age and gender for the two groups, the age should be exactly the same, but the result showed conflicting results (7.9 vs. 8.6 years). 4. Fig 1 provides a good theoretical framework for the study, but the study is simply an observational study (case-control) that cannot help to identify causal relationship between these items. thus, I suggest to remove the figure. other advanced models such as structrul equation model may be helpful in this situation. 5. one reason for the non-significant results may be due to limited sample size and the authors have not performed sample size calulation prior to study.

SPECIFIC COMMENTS TO AUTHORS

Interesting and well designed study that has a definitive conclusion to the pathophysiology of the investigated subject. Minor syntactical and spelling correction are needed, mainly regarding the spacing between words.
