2017年9月21日 - As a natural aspect of life, aging is the biological process in which a person gradually loses the ability to maintain homeostasis, physiological function, proliferation and immune responses. ... Thus, in liver cells, apoptosis or senescence may be tumor-protective mechanisms to maintain homeostasis during aging.

Whether and how **apoptosis** increases or decreases during **liver aging** remains a matter of debate. On the one hand, ineffective clearance of apoptotic bodies by neighboring phagocytes can lead to severe **liver** damage in viral hepatitis, and excessive hepatocyte **apoptosis** can aggravate **hepatic** fibrosis and cirrhosis.
