Elderly patients with inflammatory bowel disease: Updated review of the therapeutic landscape

LeBlanc JF *et al.* Treating elderly IBD

Jean-Frédéric LeBlanc, Daniel Wiseman, Peter L Lakatos, Talat Bessissow

Abstract

High-quality data remains scarce in terms of optimal management strategies in the elderly inflammatory bowel disease (IBD) population. Indeed, available trials have been mostly retrospective, of small sample size, likely owing to under-representation of such a population in the major randomized controlled trials. However, in the last five years, there has been a steady increase in the number of published trials, helping clarify the estimated benefits and toxicity of the existing IBD armamentarium. In the Everhov trial, prescription strategies were recorded over an average follow-up of 4.2 years. A minority of elderly IBD patients (1%-3%) were treated with biologics within the five years following diagnosis, whilst almost a quarter of these patients were receiving

INTRODUCTION

EPIDEMIOLOGY

PATHOPHYSIOLOGY

DIFFERENTIAL

Inflammatory bowel disease [IBD], a chronic inflammatory condition involving the gut, comprises two main subtypes, ulcerative colitis [UC] and Crohn's disease [CD]. Long believed to be a disease of the young, 10–30% of patients living with inflammatory bowel disease are over the age of 60, either having aged with IBD or developing it as an older adult.¹ Various definitions are used to describe older patients with IBD. More recently, elders with IBD have been defined as patients ≥ 60 years old....

Abstract. The population of older **patients with** inflammatory bowel **disease (IBD)** continues to grow, partly reflecting the aging global population in general. The debilitating effects of IBD on the quality of life of older patients are often underestimated.

The number of older patients with inflammatory bowel disease is anticipated to increase accordingly.

Inflammatory bowel disease

Medical Condition

A group of inflammatory conditions of the colon and small intestine

A group of intestinal disorders that cause inflammation of the digestive tract.

 Common (More than 200,000 cases per year in US)

 Diagnosis often requires lab test or imaging

 Treatments can help manage condition, no known cure

 Can be lifelong

IBD is said to be the result of autoimmune reactions. Inflammatory bowel disease (IBD) is a group of chronic inflammatory conditions of the colon and small intestine.

Elderly patients and inflammatory bowel disease

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4734955>

Feb 06, 2016 · Core tip: Inflammatory bowel disease can be mis-diagnosed as its clinical features are similar in younger and elderly patients. Therapeutic regimes may be different with elderly patients being less likely to have immunosuppressant drugs and Anti-TNF's either driven by clinican or patient preference and disease related factors.

INTRODUCTION

SOURCES AND SELECTION...

IRRITABLE BOWEL DIS

Inflammatory bowel disease (IBD) comprises ulcerative colitis (UC) and Crohn's disease (CD), relapsing and remitting diseases characterised by chronic gastrointestinal (GI) tract inflammation. Several long-standing treatments are available to control symptoms and improve the quality of life (QoL) of affected patients. Continued interest in more effective and locally targeted therapies has led to the development of biologic agents and other agents with unique mechanisms. This article will revi...

The number of older patients with inflammatory bowel disease is anticipated to increase accordingly bringing the burden of multiple comorbidities, polypharmacy with drug interactions, the aging immune system, and extended social and financial issues to overall management of an already challenging management of these patients.
