What are the risk factors for post-ERCP pancreatitis?

<https://www.medscape.com/answers/181364-14343> ▾

This patient with acute gallstone pancreatitis underwent endoscopic retrograde cholangiopancreatography. Cholangiogram shows no stones in common bile duct and multiple small stones in gallbladder.

Risk factors for post-ERCP pancreatitis: a systematic ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4035895>

May 15, 2014 · Patients with pancreatic diseases, such as obstruction of the pancreatic duct and pancreatolithiasis, needed drainage of pancreatic juice via a pancreatic stent. A similar study was reported by Masci et al. in 2003 [7], which showed that the risk factors for PEP may change according to the development of instruments and technologies.

Endoscopic retrograde cholangiopancreatography (ERCP) is a fundamental tool in the management of in magnetic resonance cholangiopancreatography (MRCP) and endoscopic ultrasound (EUS), ERCP has biliary and pancreatic diseases. With technological advances evolved into a therapeutic rather than diagnostic procedure. Nevertheless, these procedures carry significant risk, with post-ERCP pancreatitis (PEP) being the most frequent and dreaded of these (Figure 1). The incidence of pancreatitis af...

Pathogenesis of Post-Ercp

Endoscopic retrograde cholangiopancreatography (ERCP) plays an ever-expanding role in the management of diseases involving the bile duct and pancreatic duct but, as an invasive procedure, it carries significant risks to the patient. The most common complication is acute pancreatitis, which is reported to occur in 2–10% of patients overall (ranging from 2–4% in low-risk patients up to 8–40% in high-risk patients) [1, 2]. A recent meta-analysis of 108 randomized, controlled trials (RCTs) report...
