Perianal multiple Bowen's disease: a case report

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4713628>

Bowen's disease, also known as an intraepithelial squamous cell neoplasia, is a carcinoma in situ firstly reported in 1912 by a dermatologist named **Bowen** from the United States [1]. About 3%~5% of **Bowen's disease** might develop into invasive squamous cell carcinomas of mucosa and skin [2].

Abstract

BACKGROUND

Bowen's disease (BD) is a persistent, progressive intraepidermal carcinoma. BD usually occurs in areas exposed to sunlight. Involvement of the dorsum of the hand is not rare, but that of the palmar aspect is very unusual. Only a few cases have been reported in the literature.

CASE SUMMARY

Here, we report the case of a 48-year-old male patient who presented with a history of persistent local erythema lasting for 2 years on the thenar eminence of the left palm. Initially diagnosed as hand eczema, the condition did not improve with intermittent treatment with anti-allergy medications or topical glucocorticoid ointments, among other approaches. Then, the area of erythema gradually enlarged and was accompanied by mild itching. For a definite diagnosis and treatment, the patient came to our hospital. Dermoscopic examination revealed BD, and histopathological examination confirmed the diagnosis. We performed partial resection of the skin lesion followed by photodynamic therapy (PDT). No recurrence was observed at the 6-mo follow-up.

BOWEN'S DISEASE ON PALM: A RARE PRESENTATION

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3132931>

Bowen's disease may occur at any cutaneous site, which includes the areas protected from as well as exposed to sunlight. The involvement of the dorsum of the hand is not rare, but that of the palmar aspect is highly unusual. Very few cases have been published in literature about Bowen's disease occurring on the palm.

Bowen's disease [8] In Bowen's disease, lesions may be found in areas of the skin and mucous membranes including the nailbeds, palms, and soles. Individual lesions of Bowen's disease tend to persist for many years without progression to Invasive carcinoma [9]. If untreated, 5-15% will present invasion and/or metastasis.
