Type 1 diabetes in a Nigerian family - occurrence in three out of four siblings: A case report

Olamoyegun MA *et al.* Type 1 diabetes in siblings

Michael Adeyemi Olamoyegun, Oluwabukola Ayodele Ala

#### Abstract

##### BACKGROUND

Most occurrences of type 1 diabetes cases in any population are sporadic rather than being familial. Hence, type 1 diabetes among siblings is a rare occurrence and more extremely rare is for three or more siblings to develop type 1 diabetes. In this report, we described a case of a Nigerian family in which type 1 diabetes occurred in three siblings among four children with neither of parents having diabetes. Remarkably, all the three siblings are positive for glutamic acid decarboxylase (GAD) and anti-islet cell antibodies.

##### CASE SUMMARY

**1** There were four siblings (3 males and 1 female) born to a couple without diagnosis of diabetes. The eldest child (male) was diagnosed of diabetes at the age of 15, the second child (female) at the age of 11 and the fourth child (male) diagnosed at the age of 9. All the siblings presented with similar osmotic symptoms and were diagnosed of diabetes keto-acidosis. **1** All of them had markedly reduced serum C-peptide levels with high levels of GAD and IA-A2 antibodies. We could not perform

Type 1 Diabetes Odds

Climate and Clusters

Trauma as A Trigger

Just who is at risk for developing type 1 diabetes? Here's a sampling of what Dr. Warram, a Lecturer in Epidemiology at Harvard School of Public Health, said is known: 1. If an immediate relative (parent, brother, sister, son or daughter) has type 1 diabetes, one's risk of developing type 1 diabetes is 10 to 20
