SPECIFIC COMMENTS TO AUTHORS

Authors reported a well-defined case report with successfully treated with strict

hemodialysis administration and phosphate lowering medication. This case is unique due to fast occurrence of tumoral calcinosis after 24 months renal replacement therapy with peritoneal dialysis. However there are some minor concerns to be addressed: 1) Please add your native -English speaker colleague's name and signature to English editing certificate. In addition case presentation section might be divided into like "Chief complaints, History of present illness, History of past illness, Physical examination upon admission, Laboratory examinations, Imaging examinations, Pathological examinations." 2) How long did the patient followed-up with CKD in pre-dialysis period? 3) Please mention sevelamer carbonate and lantan carbonate dosage? Did the patient tolerate both these medications? When did you stop them? Is the patient still on treatment or not? 4) Authors should implicate the rationale of using both calcitriol and cholecalciferol in this case and discuss the overuse of vitamin D in the occurrence of tumoral calcinosis. The authors stated that "In our case the patient developed tumoral calcinosis due to insufficient quality of CAPD," in discussion section. I suggest adding the administration of vitamin D3 medication possibly aggravated the tumoral calcinosis. 5) Please also speculate that potential association of rapid decrease in peritoneal Kt/V via the possible calcification in peritoneal microvasculature. It might be related with the insufficiency of peritoneal dialysis. 6) Please change "CAT" abbreviation in the manuscript as CT as in figure descriptions.

is described with severe tumoral calcinosis around the hips. The cause was insufficient treatment and lack of compliance. After treatment had been adjusted, the calcifications disappeared. The clinical description in text is adequate with supplemental information from a table and CT-scans. Such cases had been reported earlier. The present paper is easy to read, and modern technology are used. The presentation is pedagogic. Only small language polishing is needed.

complete remission in a patient having end stage renal disease. This case report is clinically interesting and useful. However, there are some points that need to be addressed. Minor comments: 1. The authors should use abbreviations properly. 2.

The spacing used for abbreviations is not correct. 3. The authors performed parathyroidectomy due to tertiary hyperparathyroidism. Why did they not use cinacalcet hydrochloride.
