In clinical anesthesia using an laryngeal mask airway for airway management, central venous catheterization might be required in some patients. To avoid affecting the surgical operation and because it is easy to perform, the internal jugular vein becomes a commonly used catheterization route, and the “central landmark” is generally used. However, there are few studies on the influence of the placement of an laryngeal mask airway or the type of laryngeal mask airway on the position of the internal jugular vein and common carotid artery and the changes in blood flow of the internal jugular vein. In this randomized controlled trial study, the effect of different types of laryngeal mask airway placement on the right internal jugular vein was compared. This study is well designed. The methods are clearly described. The inclusion and excluded criteria are clear. Comments: 1. Minor language polishing should be revised. 2. Discussion is too long, please shorten it. 3. Since the patients are from 2013-2014, do the authors collect any follow up data? If so, please list the data, and make a short discussion.

Very interesting study about the effect of different types of laryngeal mask airway placement on the right internal jugular vein. The manuscript is very well written. Methods are described in detail. Results are important and excellent. A minor language editing is required. Tables should be re-checked.
