PALBI - the platelet-albumin-bilirubin score – a better predictor of outcome of acute variceal bleeding.

Early TIPS with covered stents versus standard treatment ...

[https://www.thelancet.com/journals/langas/article/PIIS2468-1253\(19\)30090-1/fulltext](https://www.thelancet.com/journals/langas/article/PIIS2468-1253(19)30090-1/fulltext)

In our randomised trial, we found that early use of TIPS in patients with advanced cirrhosis and acute variceal bleeding reduced the risk of transplantation or death compared with standard treatment. At 1 year, early TIPS was associated with an absolute risk reduction of 13% (95% CI 2–28), equivalent to treating eight patients to prevent one death or transplantation.

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5829998>

Acute variceal bleeding (AVB) remains one of the most dangerous complications of portal hypertension and is associated with significant morbidity and mortality in patients with cirrhosis. Despite the advances in AVB management, 6-week mortality still remains high and is related to the severity of the underlying cirrhosis, hepatic venous pressure gradient (HVPG), and the presence of ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3282972>

Mar 01, 2012 · Acute variceal hemorrhage (AVH), a frequent and often lethal complication of cirrhosis, occurs in up to 25% of patients with liver cirrhosis and has a 6-week mortality rate of 15-20% with each episode. Accordingly, AVH needs prompt endoscopic management.
