This is a very interesting Case Report of a very unusual benign tumor of the jejunum. The description is very clear and well done. The figures are of good quality. The review of the literature is good and the proposed way of acting is very useful.

SPECIFIC COMMENTS TO AUTHORS

In the manuscript entitled, "Rare adult jejunum lymphangioma manifested as gastrointestinal bleeding with hypogammaglobulinemia: A case report and literature review", the authors present a case of a patient with obscure overt bleeding who ultimately was found to have a cavernous lymphangioma in the jejunum. The case is generally written well and describes a fairly rare scenario. Some clarification is needed in various parts of the manuscript. Additional comments and suggestions, many of which can be easily resolved and are intended to strengthen the manuscript, are provided below:

Title: -It is difficult to read, in part because it is so long. Please consider revising, e.g. to "Jejunal cavernous lymphangioma manifested as gastrointestinal bleeding with hypogammaglobulinemia: a case report and literature review"

Abstract: -A comma is not needed in this sentence as there is only one independent clause: "We also summarize and analyze all 22 reported cases from 1961 to 2019, and propose an algorithm for identification and management of small bowel lymphangioma." -" We present a case of 29-year-old female, initially presenting..." should be changed to "We present the case of a 29-year-old female initially presenting..."

-There is no mention of the source of bleeding/melena. How do the authors know it was from a lymphangioma? -It's odd that the authors would write, "CT and capsule endoscopy/enteroscopy as first- and second-line examination, followed by curative surgery with histological diagnosis will be ideal algorithm." even though CT (enterography at that!) was falsely negative for tumor.

Core tip: -Needs extensive English language review.

Text: - Needs extensive English language review. -Can the authors comment on the difference between a lymphangiectasia, lymphangioma, cavernous lymphangioma, and lymphangiosarcoma, and which of these (if not all) can be found in the GI tract? -How did the authors find/search for the previous cases? What were the search criteria? Was this case overlooked?
