This study identified metabolite differences between right-ascending and left-descending colon from healthy adults according to BMI with UPLC-MS/MS analysis. The concept of the research is very clearly and the innovative results and conclusion may contribute to the future work. This paper is well organized and easy to understand. If authors could pay attention to correct some mistakes to improve the quality, it will be acceptable. Minor points: 1) From Line 272 to 278, Figure 1A, B, C are wrong presented as Figure 2A, B, C; 2) Table 3 and Table 4 are absent.

The references have to cited in a concise but correct and uniform way. You have to state that the patients considered had no diseases, of liver , biliary tract and previous cholecystectomy, or ileal resections or other procedures. I consider relevant the differences observed between the 2 categories of subjects; however, you can specify that many other factors, as genetic and epi-genetic are implicated as factors of cancer development. In particular, in your cases, there was a family hereditary for colon cancer?
