There is a lack of data regarding a direct comparison of Gem+nabPTX (a combination of gemcitabine and nab-paclitaxel) vs FOLFIRINOX in terms of the treatment outcome. Although this is a retrospective cohort study, the result has reference significance for clinical practice. Of course, the result needs RCT to confirm.

This study was a cohort study conducted only in a single center. However, the results were very interesting. My comments are as follows: What was the regimen of the second-line chemotherapy? How was the rate of patients who can use the second-line chemotherapy?
