Title: Prognostic factors for overall survival in prostate cancer patients with different site-specific visceral metastases: A study of 1358 patients

Authors List: Pengfei Cui, Xiaofeng Cong, Ziling Liu*

Thank you honestly for reviewing the manuscript.

Responses to the Reviewer (Reviewer's code 02992848):

Comment: Brain metastasis was always the worst prognosis in any cancer related metastasis, however, in your study liver was the worst rather than brain, can you make a have an explanation on it.

Response: According to relevant studies, we think that liver metastasis from prostate cancer is usually related to the histological type of neuroendocrine differentiation (NED). NED represents a negative risk factor in prostate cancer, which is very prone to develop mCRPC and increases significantly hazard ratio for death.
