

Dear Reviews,

It's my honor for receiving your review of my manuscript(Underwater and conventional endoscopic mucosal resection in the treatment of colorectal polyps: A meta-analysis). I have revised my manuscript according to the comments. First of all, the conclusion of my meta-analysis has been changed to 'the results suggest that UEMR is an effective technique for colorectal polyps and that it appears to have some benefits over EMR, particularly for some treatment outcomes'. Exactly, I can't conclude that the the curative effect of UEMR was superior to that of EMR according to my analysis. What's more, the size of polyps is also added. Sub-group analysis shows that UEMR has advantage in the polyps with diameters equal to or greater than 20 mm than EMR. Last of all, some formatting errors have be modified and re-polished by AJE.

Best regards

Xuan Huang
