**Practical management of seizures in renal transplant recipients**

Harpreet Sawhney, Simon S Gill

### Abstract

Seizures are not uncommon in renal transplant patients. The common aetiologies are metabolic disturbance associated with renal failure, immunosuppression and associated complications and infections. Their management can be challenging

Seizure Treatment in Transplant Patients
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3656593

Levetiracetam is the drug of choice for primary generalized seizures in post-transplant patients. When intravenous drugs are necessary for acute seizure management, benzodiazepines and fosphenytoin are the traditional and best evidence-based options, although intravenous levetiracetam, valproate, and lacosamide are emerging options.
