SPECIFIC COMMENTS TO AUTHORS

Dear editor and authors, The authors provide an interesting rare case report which is well presented. Some minor concerns should be corrected before acceptance of this manuscript for publication. 1. The pathological manifestation of SIS resembles that of common schwannoma except that no nerve root remnants can be identified in the specimen. Is this the only difference? Are there any other pathognomonic features to diagnose SIS? Please clarify your diagnosis to the authors. 2. The figure legends for Fig.1 are presented but the figures are missing. 3. The tumor in this case does not involve the spinal canal and neuroforamina. Please label this feature in Fig. 1 when revising. 4. Postoperative CT was followed in Fig. 3. When was it done?
