SPECIFIC COMMENTS TO AUTHORS

The authors have published a well-designed study detailing outcomes after surgery for slow transit constipation. The results are convincing, however, the data are largely not new, and several other studies have shown similar results. At least this does line up with other studies published. 1) My main concern is the novelty of the data presented. A recent meta-analysis and practice guideline identified 40 trials or series of outcomes after surgery for constipation (PMID: 28960923). This is cited by the authors in the manuscript. I would like the authors to comment a bit more on how their study is different from previously published series, and what are the novel findings here? Will this change practice or how we communicate with patients? 2) What was done with patients who had anorectal manometry or defecography suggesting pelvic floor dyssynergia? Where these patients excluded from surgery or were they operated on like other patients. It would also be interesting to comment on different among those with pelvic floor dyssynergia vs without (pure slow transit constipation) 3) For radiopaque marker testing why was 3 days chosen instead of 5 days using a 20% threshold cutoff. 4) Please clarify the study design. The authors say this is a retrospective study, but questionnaires were prospectively collected. Was this a retrospective analysis of prospectively collected data? Or was this a prospective study with questionnaires and timepoints planned out prior to the start of the study. 5) A good deal of english language editing also needs to occur.

SPECIFIC COMMENTS TO AUTHORS

That's a very interesting paper with novelty in this field. Please improve your language especially in the abstract. What was your criteria concerning the chosen operation IRA vs CRA, laparoscopic vs lap-assisted etc ? What was the treatment of choice in patients with anastomotic leak? Please provide a more extensive comparison with the existing literature and highlight the novelty of your paper. Thank you
