SPECIFIC COMMENTS TO AUTHORS

This is a well-written, interesting review summarizing current knowledge about the treatment of pyoderma gangrenosum with the help of cytapheresis. The article presents the benefits and side effects of this treatment, as well as potential mechanisms of action. This information is useful for clinicians taking care of IBD patients facing the problem of pyoderma gangrenosum refractory to conventional treatment. I would suggest analysing the publication of Nomura et al. "Efficacy of cytapheresis for remission induction and dermatological manifestations of ulcerative colitis" (J Clin Apher 2018).

First - this manuscript is based on information from a literature review from the last 20 years, Second - the described 23 cases of cytapheresis (18 cases of GCAP/GMA and 5 cases of LCAP), does not describe the new research methods, Third - this study is useful in clinical practice,
