SPECIFIC COMMENTS TO AUTHORS

Authors reported well-balanced manuscript with clear aim and interesting results. The aim of the study was to investigate the clinical value of serum vWF as a tumor marker in patients with T2DM combined with lung adenocarcinoma. The main finding of the study was follow: serum levels of vWF in patients with T2DM combined with lung AIS were significantly higher than T2DM patients. This finding deserves to be published, but there is minor concern regarding conclusive part. Authors have defined that "Serum vWF level may represent a novel biomarker for the early diagnosis of lung AIS", but they did not investigate predictive ability of the biomarker. I recommend authors to modify the conclusive part giving assumptions in the section "Discussion"
