Abstract

Metabolic disease including diabetes mellitus, hypertension, dyslipidaemia, obesity and hyperuricemia is a common complication after liver transplantation and a risk factor for cardiovascular disease and death. The development of metabolic disease is closely related to the side effects of immunosuppressants. Therefore, the optimization of immunosuppressive regimen is very important for the prevention and treatment of metabolic disease. The Chinese Society of Organ Transplantation as developed an expert consensus on the management of metabolic diseases in Chinese liver transplant recipients based on recent studies. Emphasis is placed on the risk factors of

Sep 12, 2019 · As the mortality rates after **liver** transplantation (LT) have been reduced, the attention has shifted to additional conditions which still compromise the quality of life and the survival of these patients, such as the post-LT **metabolic** syndrome (MS). In order to determine the prevalence and the factors associated with the post-LT MS, we carried out the present study.

Metabolic complications in liver transplant recipients

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4968123>

Jul 28, 2016 · The higher prevalence of the **MS** in **liver transplant recipients** is associated with a higher incidence of cardiovascular events than in the general population, though the risk is lower than in **recipients** of a **kidney** or **heart transplant**. This is because patients with **chronic liver disease experience** haemodynamic and **metabolic changes** resulting from peripheral ...
