Novel computerised psychometric tests as primary screening tools for the diagnosis of minimal hepatic encephalopathy

Ming Luo, Rui Mu, Jian-Fang Liu, Fei-Hu Bai

Abstract

Minimal hepatic encephalopathy (MHE) is a critical neurocognitive complication of decompensated liver cirrhosis and portosystemic shunting, which results in a wide range of cognitive deficits, including impairments in

Useful Tests for Hepatic Encephalopathy in Clinical Practice

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3918211>

The Hepatic Encephalopathy Consensus Group at the World Congress of Gastroenterology in 1998 endorsed the **psychometric hepatic encephalopathy score (PHES)** as the gold standard for **diagnosing CHE**. Over the past decade, several drawbacks of this **testing system** have been identified such as **test administration** and scoring in the outpatient setting.

Minimal hepatic encephalopathy (MHE), which shows mild cognitive impairment, is a subtle complication of cirrhosis that has been shown to affect daily functioning and quality of life. However, until 2014, relevant guidelines do not give much attention to the **diagnosis** and treatment of MHE, resulting in patients being ignored and denied the benefits of treatment.

Advances in psychometric tests for screening minimal ...

<https://europepmc.org/article/MED/31060994>

Minimal hepatic encephalopathy (MHE) is a major neuropsychiatric complication of liver cirrhosis and portosystemic shunting. Although MHE produces a spectrum of cognitive impairments in the domains of short-term attention, working memory, and executive function, it generally does not present with obvious clinical manifestation on conventional assessments.
