

In this exciting case of GOO, treated by EDGI of the excluded stomach, has been discussed. This is an unusual case which was efficiently managed by EDGI and Angioembolisation. However, I would suggest - 1) To add a brief procedural description of gastro-gastrostomy as it is challenging in this case. 2) Discuss regarding the closure of fistula if planned, after LAMS removal as it is the third stage of any EDGI. 3) It would be worthwhile to introduce pre and post-angioembolisation image 4) Please ensure that the references are written as per journal standards. 5) Few grammatical errors like inconsistent hyphenation for gastro-gastrostomy and article should be corrected.

Is the "Peer-Review Report" the same as the initial review report? If so, here is a point-by-point response to the items in the report:

1) To add a brief procedural description of gastro-gastrostomy as it is challenging in this case-

Added to revised manuscript

2) Discuss regarding the closure of fistula if planned, after LAMS removal as it is the third stage of any EDGI

- Added section discussing that the LAMS would be removed in the future

3) It would be worthwhile to introduce pre and post-angioembolisation image

- Added these images to the revised manuscript

4) Please ensure that the references are written as per journal standards

- Ensured that the references are written per journal standards

5) Few grammatical errors like inconsistent hyphenation for gastro-gastrostomy and article should be corrected

- These inconsistencies were corrected If this is not the report to which you are referring, please let me know where I can find the "Peer-review report" So I can compile a point-by-point response. Thank you so much for your time.
