**Mirizzi's syndrome: A scoring system for preoperative ...**  
<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6151998>  
INTRODUCTION. In 1948, the Argentinean surgeon Pablo Mirizzi [] described a patient with partial obstruction of the common hepatic duct (CHD) secondary to impacted biliary stone in the cystic duct or in the infundibulum of the gallbladder, associated with an inflammatory response involving the cystic duct and the CHD. This presentation became known as **Mirizzi's syndrome** (MS).

**Predicting cholecystocholedochal fistulas in patients with Mirizzi syndrome undergoing endoscopic retrograde cholangiopancreatography**

Wu CH *et al.* Cholecystocholedochal fistulas by ERCP in Mirizzi syndrome

**Abstract**

**BACKGROUND**

Mirizzi syndrome (MS) is defined as an extrinsic compression of the extrahepatic biliary system by an impacted stone in the gallbladder or the cystic duct leading to obstructive jaundice. Endoscopic retrograde cholangiopancreatography (ERCP) could serve diagnostic and therapeutic purposes in patients with MS, including the relationships between the cystic duct, the gallbladder, and the common bile duct (CBD). Cholecystectomy is a challenging procedure for a laparoscopic surgeon in patients with MS, and the presence of a cholecystocholedochal fistula renders preoperative diagnosis

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4745623>

The **Mirizzi syndrome** (MS) is an impacted stone in the cystic duct or Hartmann's pouch that mechanically obstructs the common bile duct (CBD). We would like to report laparoscopic subtotal cholecystectomy (SC) and resection of cholecystocolic **fistula** by the help of Tri-Staple™ in a case with type V MS and cholecystocolic **fistula**, for first time in the literature.
