Retrospective Cohort Study

Periodontitis combined with smoking increases risk of the ulcerative colitis: A national cohort study

Kang EA *et al.* Impact of periodontitis and smoking on UC

Abstract

BACKGROUND

Periodontitis is a chronic inflammation of periodontal tissues. The effect of periodontitis on the development of inflammatory bowel disease (IBD) remains unclear.

AIM

We assessed the risk of IBD among patients with periodontitis, and the risk factors for IBD related to periodontitis.

METHODS

A nationwide population-based cohort study was performed using claims data from the Korean National Healthcare Insurance Service. In total, 9,950,548 individuals aged ≥ 20 years who underwent national health screening in 2009 were included. Newly
