Retrospective Study

Comparison of prognostic factors at different age and prognostic significance of neutrophil-lymphocyte ratio in patients with gastric cancer

Linyi Huang, Qiong Li, Huiping Xue

Abstract

BACKGROUND

Gastric cancer (GC) is one of the most common malignant tumors in the world. Albeit in recent years tremendous progress has been made in early detection, the postoperative overall survival (OS) of GC patients remains extremely low. A number of studies have shown that, to varying degrees, the age affects the prognosis of patients with GC.

Methods. The study population consisted of 174 advanced **gastric cancer patients**. **Patients** were treated with 85 mg/m² of oxaliplatin as a 2-h infusion at day 1 plus 20 mg/m² of leucovorin over 10 min, followed by 5-FU bolus 400 mg/m² and 22-h continuous infusion of 600 mg/m² at days 1-2. Treatment was repeated in 2-week intervals.

Introduction: Hepatocellular carcinoma (HCC) has a poor **prognosis** and is ranked in the top 2 leading causes of death in Taiwan. The clinical features which affect survival rate should be noticed for alarming. We tried to study the **neutrophil-lymphocyte ratio** (NLR) and platelet-lymphocyte **ratio** (PLR) for the predictor **of prognosis** of HCC.
