

Editor-in-Chief:

We sincerely appreciate your comments that make this manuscript more complete.

Reviewer 1

In this study the authors report an 84-year-old female with gastroduodenal intussusception caused by gastric GIST (gastrointestinal stromal tumor). The case report is well documented, scientifically satisfactory and rigorous. The treatment performed is wide despite the rarity of the pathology. Patients were adequately studied and the results achieved are satisfactory. The bibliography is extensive and updated.

Answer: Thanks

Reviewer 2

Gastroduodenal intussusception due to the gastrointestinal stromal tumors is infrequently described in the literature. Authors present a case of gastroduodenal intussusception due to the low-risk gastrointestinal stromal tumor resected by endoscopic intervention with complication. There are reports about endoscopic reduction of gastroduodenal intussusception (Park YM, Clinical Gastroenterology and Hepatology, 2019;17:e133-e133) and endoscopic resection of tumor to prevent recurrence of gastroduodenal intussusception as cited by the authors (Yamauchi K, et al. Intern Med 2017;56:1515-9). The presentation of the case is satisfactory and describes a rare case.

Answer: Thanks
