

Interesting case report. The case presentation section should be revised according to the journal's guideline. And a minor editing is required. Thank you. No other specific comments.

This is an interesting case of mesenteric ligamentous fibromatosis that was misdiagnosed as stromal tumor before surgery. This case is rare, and the manuscript is very well written. The discussion is too long, please short it. And some minor language polishing should be corrected.

Reviewer1: The case presentation section have been revised according to the journal's guideline, and a minor editing was done.

Reviewer2: Modifications have been made to the discussion section.
