Hemosuccus Pancreaticus as a Rare Complication of ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4891628>

Hemosuccus pancreaticus is usually **caused** by rupture of a **pseudoaneurysm** of a **peri-pancreatic artery**, often the **splenic artery**, in the setting of **pancreatitis**; other **causes** are very rare. In this report, for the first time to our knowledge, we present a case of **hemosuccus pancreaticus** that occurred as a complication of bariatric surgery.

Hemosuccus pancreaticus is a very rare cause of gastrointestinal bleeding and can be life-threatening if not managed appropriately. Still thought to be a surgical problem, advances in medical therapy now afford these patients the opportunity to undergo less-invasive angiography techniques to manage this illness when it occurs. Here, we present a case of hemosuccus pancreaticus safely managed with liquid N-butyl-2-cyanoacrylate embolization.

Hemosuccus pancreaticus is an especially rare cause of gastrointestinal bleeding. It is defined as bleeding into the duodenum from the Vater papilla through the route of the pancreatic duct, also known as Wirsungorrhaghia [1 1. J. Ferreira, A. B. Tavares, E. Costa, and J. Maciel, "Hemosuccus pancreaticus: a rare complication of chronic pancreatitis," BMJ Case Reports, 2015. View at: Publisher Site| Google Scholar See in References –3 1. B. Han, Z.-F. Song, and B. Hemosuccus pancreaticus

Rare Cause

Hemosuccus pancreaticus is a rare cause of hemorrhage in the gastrointestinal tract. It is caused by a bleeding source in the pancreas, pancreatic duct, or structures adjacent to the pancreas, such as the splenic artery, that bleed into the pancreatic duct, which is connected with the bowel at the duodenum, the first part of the small intestine. Patients with hemosuccus may develop symptoms of gastrointestinal hemorrhage, such as blood in the stools, maroon stools, or melena, which is a dark, tarry stool caused by digestion of red blood cells. They may also develop abdominal pain. It is associated with pancreatitis, pancreatic cancer and aneurysms of the splenic artery. Hemosuccus may be identified with endoscopy, where fresh blood may be seen from the pancreatic duct. Alternatively, angiography may be used to inject the celiac axis to determine the blood vessel that is bleeding. This may also be used to treat hemosuccus, as embolization of the end vessel may terminate the hemorrhage. However, a distal pancreatectomy—surgery to remove of the tail of the pancreas—may be required to stop the hemorrhage.

DISCUSSION. Lower and Farrell first described bleeding through the pancreatic duct due to the rupture of a splenic artery in 1931 [], but the term hemosuccus pancreaticus was coined by Sandblom in 1970 []. In his case reports, he described three cases of hemosuccus pancreaticus; in two cases, the source was a ruptured aneurysm of the common hepatic artery and, in one case, an aneurysm of the ...
