SPECIFIC COMMENTS TO AUTHORS

This is a case of a patient with basal cirrhosis due to HBV, where the authors did not describe the Child-Pugh, the MELD, the MELDNa, all of these must be calculated in order to assess adequately this case in compensated or decompensated cirrhosis. EH is one of the most important clinical manifestations of decompensation of chronic liver disease and can be present in a high proportion of patients particularly in those assessed as Child B and even most frequent in those Child C. Please specify more clearly previous history about cirrhosis in this case.
