Abstract

Amyloidosis, a heterogenous group of disorders, is characterized by the extracellular deposition of autologous, insoluble, fibrillar misfolded proteins. These extracellular proteins deposit in tissues aggregate in β -pleated sheets arranged in an antiparallel fashion and cause distortion to the tissue architecture and function. In current literature, about 60 heterogeneous amyloidogenic proteins have been identified, out of which 27 have been associated with human disease. Classified as a rare disease, amyloidosis is known to have a wide range

Review article: gastrointestinal amyloidosis - clinical ...

<https://pubmed.ncbi.nlm.nih.gov/18363891>

Methods: **Review** of current medical literature. Results: **Amyloid** proteins (irrespective of the type) can deposit in various parts of the **gastrointestinal** tract and liver resulting in symptoms of abdominal pain, dysmotility, diarrhoea, **gastrointestinal** bleeding, hepatomegaly and even portal hypertension with its associated complications. Definitive **diagnosis** can only be made by histological examination of the ...

Review article: gastrointestinal amyloidosis – clinical ...

<https://onlinelibrary.wiley.com/doi/full/10.1111/j.1365-2036.2008.03682.x>

Mar 18, 2008 · **Amyloidosis** is defined as the extracellular deposition of nonbranching fibrils composed of a variety of serum-protein precursors. 1, 2 Different low-molecular-weight (5–25 kDa) proteins have been found to deposit in various organs, 3 thus creating subunits that provide the basis for the classification of **amyloidosis**. 1, 4, 5 The accepted classification of **amyloidosis** has been published by Husby. 5
