Case Report - PubMed Central (PMC)

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3411538>

Case Report. A 63-year-old man presented to our hospital with excessive thirst, polydipsia, and polyuria. He had been diagnosed as having acute hepatitis B at age 35 years, at which time a liver biopsy had resulted in massive bleeding requiring blood transfusion. At age 48 years, he was diagnosed as having chronic HCV (genotype 1b).

Antineutrophil cytoplasmic antibodies (ANCA)-positive ...

[https://jmedicalcasereports.biomedcentral.com/...](https://jmedicalcasereports.biomedcentral.com/)

Jul 06, 2020 - Antineutrophil cytoplasmic antibodies comprise a family of autoantibodies that are often used as biomarkers for certain forms of small-vessel vasculitis; however, chronic infections tend to induce the production of antineutrophil cytoplasmic antibodies. Infective endocarditis and hepatitis B virus infection have been reported to exhibit antineutrophil cytoplasmic antibody positivity and to ...

Nov 28, 2019 · **Hepatitis B** virus (HBV) reactivation due to immunosuppressive therapy is an important therapeutic complication of rheumatic diseases. HBV reactivation is less frequent in patients with resolved HBV infection than in HBV carriers or those with **chronic HBV hepatitis**; however, the number of patients is several times more in the resolved infection group than in the **chronic** infection group.

Negative conversion of autoantibody profile in chronic hepatitis B: A case report

Xun Zhang, Dong-Mei Zhao, Qin-Xiu Xie

Abstract

BACKGROUND

Autoimmune antibodies are detected in many diseases. Viral infections are accompanied by a number of immunopathological manifestations. Some autoimmune antibodies have been associated with the immune response induced by virus or drugs. Thus, a comprehensive diagnosis of chronic hepatitis B combined with autoimmune hepatitis (AIH) is required and immunosuppressant or antiviral therapy should be
