An anaplastic large-cell lymphoma (ALCL) is an extremely rare type of PBL, and it remains unclear whether ALCLs that primarily involve the bone exhibit favourable or unfavourable biological behaviour, and whether they are similar to ALCLs in general, or not. We reported a case of ALK-positive ALCL with primary bone involvement, and reviewed the ...

Anaplastic large-cell lymphoma is a form of cancer. It is a type of non-Hodgkin lymphoma involving aberrant T cells or null lymphocytes. The term anaplastic large-cell lymphoma encompasses at least four different clinical entities with the same name, which on histological examination share the presence of large pleomorphic cells that express CD30 and T-cell markers. Two types of ALCL present as systemic disease and are considered as aggressive lymphomas, while two types present as localized disease and may progress locally. Anaplastic large cell lymphoma is associated with various types of medical implants.
