Safety of pancreatic surgery with special reference to antithrombotic therapy: A systematic review of the literature

Takahisa Fujikawa, Shigetoshi Naito

Abstract

BACKGROUND

Postpancreatectomy hemorrhage (PPH) is the most severe type of complication after pancreatic surgery, although the effect of antithrombotic therapy (ATT) on PPH is largely unknown. The safety and efficacy of chemical thromboprophylaxis for venous thromboembolism (VTE) remains controversial.

AIM

To elucidate the effect of ATT on PPH.
