***Klebsiella pneumoniae* infection of spontaneous renal rupture that presented only as fever: A case report**

Zhang CG *et al.* *Klebsiella pneumoniae* infection of spontaneous renal rupture

## Abstract

### BACKGROUND

Spontaneous renal rupture is a rare disease in the clinic. The causes of spontaneous renal rupture include extrarenal factors, intrarenal factors and idiopathic factors. Reports on infection secondary to spontaneous renal rupture and the complications of spontaneous renal rupture are scarce. Furthermore, there are few patients with spontaneous renal rupture who present only with fever.

*Klebsiella pneumoniae* (KP) is a Gram-negative bacilli exists in upper respiratory tract and intestine, it is known as an important opportunistic pathogen and a common cause of hospital-acquired infection. The drug-resistance is mainly associated with the carbapenemase in KP, as a result, a range of broad-spectrum antibiotics are ineffective to carbapenem-resistant *K. pneumoniae* (CRKP), and the emergence of CRKP poses a serious threat to public health worldwide.[1,2] Cadaveric solid organ transplantation (S
