SPECIFIC COMMENTS TO AUTHORS

This is an interesting case report, which shows a rare case of cholangiojejunostomy for multiple biliary duct in living donor liver transplantation. Laparoscopic living donor hepatectomy is a widely accepted management algorithm to treat ornithine transcarbamylase deficiency. This report will add further data to the pool for future treatment algorithms formations.

SPECIFIC COMMENTS TO AUTHORS

This is a interesting case report about simple technique of biliary reconstruction in liver transplant setting. The outcome of choledochojejunostomy was quite good in short-term follow up. I have a few comment for this case report; (1) Add more data about OTC in this patient and indication for liver transplantation. As she present the symptom at age 2 years, it might be the partial OTC enzyme deficiency that usually response with protein diet restriction and medications that stimulate the removal of nitrogen from the body. (2) As choledochojejunostomy might increase risk of post-operative cholangitis, how about cholangitis in this case? Please mention this complication in the content. How long did you give her the antibiotics prophylaxis? (3) for figure, could you please put arrow head at the 4 biliary tracts in MRCP and intraoperative finding. It will be good for clinician who do not familiar with imaging and surgical view.
