Duct-to-Duct Biliary Reconstruction in Living Donor Liver ...

<https://journals.lww.com/annalsofsurgery/Abstract/...>

cojejunostomy has been a standard procedure for biliary reconstruction in LDLT with a partial hepatic graft. However, end-to-end choledochocholedochostomy is the technique of choice for biliary reconstruction and yields a more physiologic bilioenteric continuity than can be achieved with Roux-en-Y hepaticojejunostomy. The authors performed right lobe LDLT with end-to-end duct-to-duct biliary ...

[Donor double common bile duct in living donor liver ...](#)

<https://onlinelibrary.wiley.com/doi/full/10.1111/tri.12619>

Dear Sirs, We read with interest the recent article by Iwasaki et al . 1 focusing on the safety in **living donor liver transplantation** (LDLT). We confronted a **living donor case** of double common bile **duct** (DCBD), an extremely rare congenital anomaly which could involve surgical pitfalls that could lead to serious injuries of the bile **duct** and make **biliary** reconstruction more complicated in LDLT ...

Background: **Biliary** anastomosis is crucial in **living donor liver transplantation** to ensure physiologic bilioenteric continuity. Presence of **multiple** ducts in the graft is challenging in **living donor transplantation** era. **Biliary** strictures and bile leaks account for the majority of **biliary** complications after **living donor liver transplantation**.

Does Multiple Bile Duct Anastomosis in Living Donor Liver ...

<https://www.sciencedirect.com/science/article/pii/S0041134518318499>

Sep 01, 2019 · Living-donor liver transplantation (LDLT) has developed into a well-recognized treatment option for patients with end-stage liver disease. Biliary complications, including leakage and strictures, remain a major cause of morbidity, dysfunction, and mortality in liver transplant recipients.

Biliary Reconstruction in Living Donor Liver ...

[https://journals.lww.com/transplantjournal/...](https://journals.lww.com/transplantjournal/)

Backgrounds. Bile duct complications especially biliary stricture remains a major cause of morbidity influencing the postoperative course in living donor liver transplantation (LDLT). The objectives of this study were to investigate the outcome of biliary reconstruction using "open-up" anastomotic technique and to clarify the risk factors for biliary stricture after LDLT.
