Adult Paget's disease of bone | RCP Journals

<https://www.rcpjournals.org/content/clinmedicine/20/6/568>

Nov 01, 2020 · Adult Paget's disease of bone is the second commonest metabolic bone condition after osteoporosis. The condition is characterised by increased bone cell activity, with bone-resorbing osteoclasts often larger and containing more nuclei than normal and osteoblasts producing increased amounts of disorganised bone. This leads to expanded bone of poor quality possessing both sclerotic ...

<https://pubmed.ncbi.nlm.nih.gov/19537656>

Paget's disease is the second most common bone disease following osteoporosis. Paget's disease is characterized by abnormal resorption and deposition of bone. The most widely used agents to treat Paget's disease are bisphosphonates. Bisphosphonates have been given much attention due to reports of osteonecrosis associated with their use.

<https://www.ncbi.nlm.nih.gov/pubmed/20886248>

In this report, we describe the case of a 65-year-old female with clinical and radiological findings of active Paget's disease of bone, but with absence of abnormal biochemical markers. The patient was given a dose of 5 mg zoledronic acid intravenously with significant clinical improvement within the next 6 months.
