

Specific Comments To Authors: The case series appears interesting, however, the authors did not provide sufficient data to demonstrate that the transformation truly occurred. They need to provide histological pictures of each case, and if possible, NGS profile or expression profile to indicate that the tumors have indeed transformed to a different histologic type. The language is another issue, it requires extensive revision.

Thank you for your suggestions. The manuscript has been revised according to your comments and suggestions. Firstly, I have provided the pathological results of nine patients before and after transformation showed in the figure 1 and table 2. Secondly, I have provided the language editing certificate. Thirdly, I have provided the PubMed numbers to the reference list.
