SPECIFIC COMMENTS TO AUTHORS

The outbreak of the COVID 19 pneumonia is currently evolving. This article reviewed the causes, prognosis and management of liver injury in COVID 19. Inflammatory storms, hypoxia, drug factors, and viral damage to liver cells are participated in liver injury. Finding the mechanism of liver injury in COVID 19 is challenging and significant for better treatment. But the paper needs further revision for its defects. 1.In the discussion of prognosis, you said males were highly likely to develop liver damage. But at the end of the paragraph, it is said that factors significantly associated with liver damage included female sex. Please explain that. 2.Asymptomatic infection is also a research hotspot. You may aslo review liver damage in asymptomatic infection. 3.There have been many reviews on liver injury and its potential mechanisms in COVID 19. You can go deep into the treatment and prognosis. 4.There still exist grammar and punctuation errors.
